Out of passion for the horse.

True craftsmanship and carefully selected materials

The protection of the horse's sensitive mouth is most important to us, which shows in the use of the chosen materials. From bit ring to curb, all metal parts are formed by hand, welded and polished to perfection. To guarantee the safety of the bits for horse and rider, they go through vigorous tenacity testings. The newly developed form of our mouthpieces provides a better acceptance of the bit and alleviates the communication between horse and rider.

Plastic-Compound

Our beris mouthpieces are made of a food safe plastic compound with a surface refinement unequalled so far in the range of plastic bits. The surface is very smooth and they slide easily in the mouth, even if the horse doesn't salivate that much. The "eraser like effect" known of rubber bits will not occur with our mouthpieces! Horses accept them very well and will often be encouraged to chew and salivate more.

Eggbut Bit

120, 130 und 140 mm / soft, medium and hard

The form of the mouthpiece as well as the soft transition to the rings prevents pinching and the bit sets still in the horse's mouth. It's suitable for most of the horses.

Eggbutt Jointed

125, 135 und 145 mm / medium

The Jointed Bit will put more pressure on the jaws and on the sides of the tongue. Within appropriate use a single joint in the bit will disturb the blood flow in the tongue not substantially. Our single jointed Eggbut Snaffle is made of a medium flexible, food safe plastic compound.

To soften the pressure on the jaw we designed an extra flexible zone at the side of the mouthpiece. Due to shape and the angulation of the joint it will rest evenly on the tongue.

Comfort Bit

120, 130 und 140 mm / soft and hard

This anatomically correct bit rests equally on tongue and bars and offers more room and mobility for the tongue. With this bit the pulled rein will apply pressure evenly on tongue and bars. A lateral squeezing of tongue and bars will not happen. Also a pinching of the lips will be impossible by using bit guards. The Comfort Bar lies thanks to its shape very still in the horses' mouth.

Mullen Mouth bits are considered to be fairly mild which enables the rider to communicate with his horse in a more gentle and delicate way. The soft Comfort Bit is ideal for young and sensitive horses.

Mouthpieces

Comfort Bit thin

100, 110, 120 and 130 mm / soft and hard

Similar in shape with the Comfort Bar, just the diameter is with 15 mm a lot thinner. This recommends the bit for ponies and horses with non spacious mouths. Very successful is the usage as a Weymouth Bit for horses that cannot take a thick Weymouth and a Bradoon Bit.

Tale & Krümel

The ponybits will be delivered with the appropriate size of cheeks.

Tongue Port Bit

120, 130 und 140 mm / soft and hard

The Tongue Port Snaffle gives the horse's tongue enough room because of the flattened area on the port. Many horses react to this with more relaxation and chewing. Therefore this bit is perfect for horses that won't tolerate pressure on the tongue and for those who tend to stick their tongue above the bit.

Height of the Tongue Port 30 mm

beris KONNEX

130 und 140 mm / soft and hard

The KONNEX-Bit is to be understood as the deliberate summary of positive characteristics of our proven Tongue Part and our Butterfly Bit. The bit itself is slimmer, it positions itself very comfortable in the horse's mouth. Also in the KONNEX-Bit the proved beris Tongue Port offers generous space to the sensitive tongue muscle. Additionally here the bit widens itself in area of the port. That means to spread the pressure of the rein on a greater area of the tongue, the tongue will be protected from too much pressure on a small area.

Suitable is the KONNEX-Bit for horses with little space in their mouth, e.g. thoroughbred type horses, or older horses (due to the dental changes), horses with large-scale tongues and especially the ones who do not tolerate too much pressure on the tongue.

Height of the Tongue Port 30 mm

beris KONNEX

The successful combination of two classics!

Nicola Philippaerts and H&M Harley vd Bisschop

The initial idea was to develop a thinner mouthpiece with the proven effect of our Tongue Port Bit. During the phase of development we also became inspired by the characteristics of the Butterfly Bit. In conclusion the KONNEX-Bit is to be understood as the deliberate summary of positive characteristics of both.

The bit itself is slimmer, it positions itself very comfortable in the horse's mouth. Also in the KONNEX-Bit the proved beris Tongue Port offers generous space to the sensitive tongue muscle. Additionally here the bit widens itself in area of the port. That means to spread the pressure of the rein on a greater area of the tongue, the tongue will be protected from too much pressure on a small area.

Suitable is the KONNEX-Bit for horses with little space in their mouth, e.g. thoroughbred type horses, or older horses (due to the dental changes), horses with large-scale tongues and especially the ones who do not tolerate too much pressure on the tongue.

Mouthpieces

Butterfly Bit

120, 130 und 140 mm / soft and hard

Our Butterfly Bit Snaffle is an absolute innovation in regard of mouthpieces. The anatomically correct form in combination with a broader surface in the tongue area offers this sensitive muscle the optimal amount of room space with a very soft influence at the same time.

Horses show their wellbeing with more chewing activity and an increased acceptance of the bit. If a stronger effect of the horse's mouth is necessary a leverage acting cheek may be helpful.

beris PRIME

120, 130 und 140 mm / supersoft

beris PRIME sets new standards in communication between horse and rider. Due to the anatomical shape of the extreme soft mouthpiece the pressure is equally spreaded on tongue and bars. The integrated oval bit guards with it's carefully shaped passages to the centerpiece prevent pinching the horse's lips and grant lateral support.

Cleaning Instructions for plastic compound:

The mouthpieces should be rinsed with clean water after every use.

We manufacture the tailor made bit for your horse!

Please contact us.

beris PRIME

Highest quality and functionally perfect design!

Kevin Staut & For Joy van't Zorgvliet

beris PRIME sets new standards in communication between horse and rider. Due to the anatomical shape of the extreme soft mouthpiece the pressure is equally spread on tongue and bars. The integrated oval bit guards with its carefully shaped passages to the centrepiece prevent pinching the horses' lips and grant lateral support.

Our premium mouthpiece *beris* PRIME is made of a food safe plastic compound with a surface refinement unequalled so far in the range of plastic bits. The chosen plastic compound is made of a super soft material, increasing chewing activity and more salivation. Therefore the „Eraser like effect“ will not occur with our *beris* PRIME. Even if the horse doesn't salivate that much this bit slides easily in the mouth because of its refined surface.

To be on the safe side we added an inlay of steel inside the super soft material of the *beris* PRIME. The stainless steel cheeks are made with the most significant artisan knowledge and finally fitted precisely to their sockets

Mouthpieces

Leather

Horses do accept leather bits very well. Virtually every horse likes the feeling of leather in its mouth and reacts with increased chewing activity and more salivation. The more salivation, the better slides the bit in the mouth what means an increased well being of your horse. Our mouthpieces are tanned vegetable and stitched by hand.

Leather Bit

120, 130 und 140 mm / soft and hard

Leather Bits slides easily in the mouth what means an increased well being of your horse. The anatomical shape of the mouthpiece adjusts when wet even more perfect to the anatomy of the horses' mouth.

Extremely well suited is our leather mouthpiece for young and highly sensitive horses, disliking all other materials. Even horses that generally dislike bits in their mouth often accept this material and can learn to trust the hand of a gentle rider again.

Care instructions for leather:

Prior to the first use the mouthpiece should be soaked thoroughly in cooking oil. Please repeat since the leather seems dry. Prior to every use the mouthpieces should be soaked briefly in cold water and rinsed after use because saliva can erode the leather quickly.

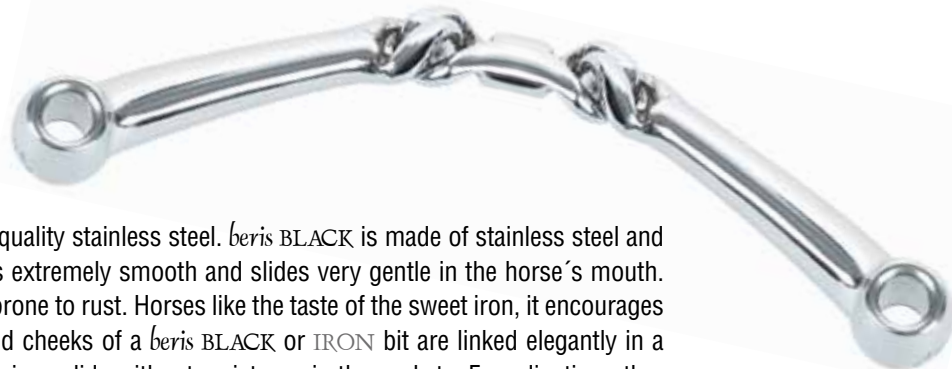

Due to the Material

Mouthpieces made of a plastic compound or leather are contrary to those made of metal significantly softer and weigh a lot less. This is what most horses love about these bits. But the horses' teeth are considerably harder than any plastic compound or leather and can shorten the lifespan of a mouthpiece made of these materials. If the bit is correctly placed in the dental free area between the Incisors and Molars (Diastema), a damage done to the mouthpiece is quite unlikely, but caused by sharp edged-teeth not impossible.

For these reasons we cannot offer any warranty for damages due to bite marks or incorrect placement of the bit.

beris IRON + beris BLACK

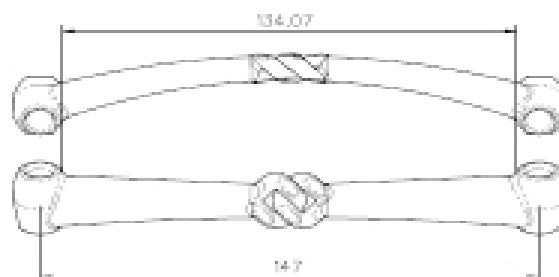

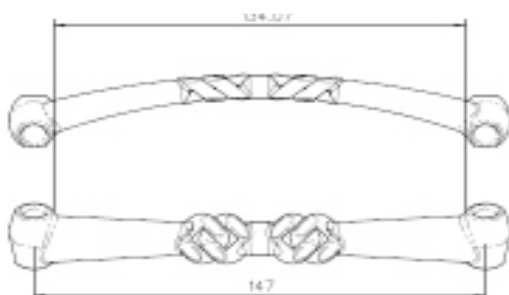

beris IRON bits are made exclusively of high quality stainless steel. *beris* BLACK is made of stainless steel and sweet iron. The surface of a *beris* IRON bit is extremely smooth and slides very gentle in the horse's mouth. The sweet iron parts of a *beris* BLACK bit are prone to rust. Horses like the taste of the sweet iron, it encourages more salivation and chewing. Mouthpiece and cheeks of a *beris* BLACK or IRON bit are linked elegantly in a eggbutt shaped socket. Precisely fitted loose rings slide without resistance in the sockets. For adjusting other sides to the mouthpiece we integrated the eggbutt shaped socket in a carefully designed transition. Pinching the lips becomes impossible!

The profile of the the *beris* IRON and *beris* BLACK series are ovaly shaped to occupy only the really needed space in the horse's mouth. Additionally the mouthpiece lies broadly on jaws and tongue to distribute the pressure. To achieve the broad based contact between bit and mouth we installed the socket slightly rotated.

A functionally new link for bits.

Without the disadvantages of a common jointed one.

Our absolutely new beris joint rests flat and broad on the horse's tongue. Putting pressure on the reins means all parts will work together to distribute the pressure evenly! The very mobile bit in the mouth encourages chewing and salivation!

beris IRON + beris BLACK

Single Jointed

115, 125, 135 und 145 mm

Our *beris* joint rests flat and broad on the horse's tongue. Putting pressure on the reins means all parts will work together to distribute the pressure evenly! The very mobile bit in the mouth encourages chewing and salivation!

Double Jointed

115, 125, 135 und 145 mm

No matter if single or double jointed, both mouthpieces – a filigree example of true craftsmanship – impress with their beautifully designed transitions.

Precision and delicate communication – uncompromisingly united in this bit.

Tongue Port Bit

110, 120, 130 und 140 mm

A true metal copy of our proven *beris* Tongue Port.

The Tongue Port Bit gives the horses' tongue enough room because of the flattened area on the port. Many horses react to this with more relaxation and chewing. Therefore this bit is perfect for horses that won't tolerate pressure on the tongue and for those who tend to stick their tongue above the bit.

Height of the Tongue Port: 30 mm

Tongue Port Bit Low

110, 120, 130 und 140 mm

Height of the Tongue Port: 15 mm

Our Models

beris

A stylized, dark brown silhouette of a horse's head, facing right. The silhouette is integrated with the word "beris", which is written in a dark brown, serif font. The horse's head is positioned to the right of the word, with its neck and head outline extending from the end of the word.

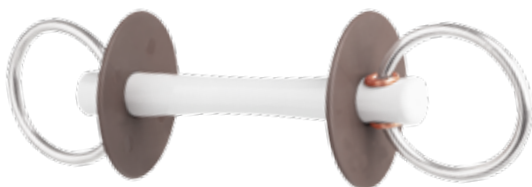

Loose Ring Bit

A loose ring means increased mobility of the bit.

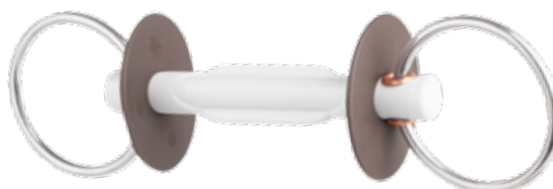

The Loose Ring is meant for horses who prefer this “mobility“ and offers you the opportunity to choose additionally the best matching mouthpiece. The ring of the plastic and leather mouthpieces runs smoothly in its copper sockets and this increases the lifespan of the bit substantially.

Eggbut Snaffle

The form of the mouthpiece as well as the soft transition to the rings prevents pinching and the bit rests stable in the horse's mouth. With its form and different available ring sizes this bit is well suited for young horses. The smaller the rings, the faster and more direct is the rider's influence. The bigger the rings, the softer the influence. With different degrees of hardness of the mouthpiece available this bit can be used with almost any horse.

3-Ring-Bit

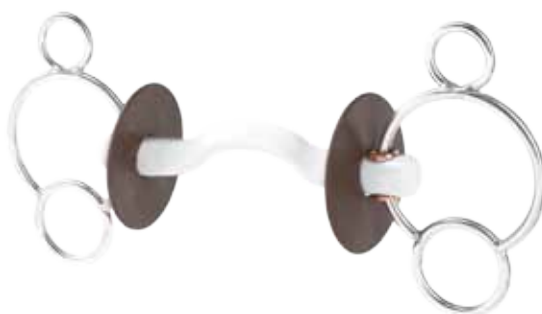

Combines eteral restriction, leverage and pull open effect in one bit. The level of control depends on the ring the rein will be attached to. Using the large ring the effect will be similar to a loose ring or an regular eggbutt. The lower ring has a mild leverage effect. The 3-ring bit is often used to test the horse's reaction to leverage.

Kimblewick Bit

Effective combination of influence on the horse's lower jaw, pressure on the poll and change location inside the horse's mouth. Three different strap up options allow a well-regulation of the bit. The side parts of the bit offer a certain weight, which quiets and relaxes nervous horses.

Second rein acts with slight leverage on the lower jaw branches. This bit puts its pressure evenly on the lower jaw and is generally well accepted by horses. It allows a "letting go" of the curb chain for a bigger range. The pressure can be increased as needed. This bit is great for strong horses which push forward.

Dressage Curb Bit

Elegant design combined with highest comfort for the horse's sensitive mouth: This is the new *beris* dressage curb bit. Combined with either short (5 cm) or long (7,5 cm) shanks the bits are perfectly adjustable to anyone's needs.

From the overly sensitive horse to one that needs a stronger contact. The mouth piece is generally well accepted, no matter which degree of hardness is used. Promotes chewing activity.

A classic bit with elegant and refined design. Pressure on lower jaw and poll, depending on length of the curb (5 cm or 7,5 cm). The angle of the bit can be adjusted. Possible use for horses that have difficulties to come through, for „sultry“ horses, for horses that need clear corrections in critical situations (like time events). The Pelham will be delivered with either nylon strap or curb hooks upon request.

Now it's horse's choice!

beris AUTOPILOT

The *beris* AUTOPILOT

We developed an absolutely new cheek that positions itself automatically in the horse's mouth in a way that it applies only the lowest pressure to jaw and tongue. Anatomy of the mouth varies, as well as the preferences to the position of the mouthpieces. Now the horse can choose the most comfortable position of the mouthpiece on its own. Putting pressure on the rein means to increase pressure on tongue and jaw, but the mouthpiece rests stabil in the position the horse likes best.

Furthermore using a chinstrap or a curb chain reduces the pressure on the poll substantially.

beris AUTOPILOT

We developed an absolutely new cheek that positions itself automatically in the horse's mouth in a way that it applies only the lowest pressure to jaw and tongue. Anatomy of the mouth varies, as well as the preferences to the position of the mouthpiece. Now the horse can choose the most comfortable position of the mouthpiece on ist own. Putting pressure on the rein means to increase pressure on tongue and jaw, but the mouthpiece rests stabil in the position the horse likes. The *beris*-AUTOPILOT will be delivered with either ny on strap or curb hooks upon request.

Furthermore using additionally a chinstrap or a curb chain reduces the pressure on the poll substantially.

Proudly we present our Tango! The absolute innovation that spreads the pressure of the rein equally on the horse's head. The first rein applies pressure on the jaws and the nose, the second rein acts like an on/ off curb chain. Very suitable for too „hot“ horses, that won't tolerate single pressure on the mouth and those who just prefer a more evenly distribution of the rein pressure.

To be used with one set of reins. The pressure is distributed evenly between the horse's nose, lower jaw and poll. More rein action puts some pressure on the angle of the mouth. Suitable for horses that are very sensitive in the mouth, but can't be ridden with a Hackamore only.

The Filet places itself perfectly in the mouth. When a contact is taken the upper arm is angled forwards causing the mouthpiece to lift - thereby suspending it in the mouth and reducing the pressure across the tongue and the bars of the mouth. This is often beneficial for cases of over sensitivity. If the horse is going forward into a contact and active behind this will encourage a rounding action and help tremendously with the outline.

The Fulmer is a variation of the Full cheek. The extended cheek bars, above and below the mouthpiece help to guide the horse's head in the turns whilst the loose ring makes it a more mobile bit. So this bit may be useful if the horse goes better in a loose ring or leans in a fixed cheek bit.

Lunging-Vaulting-Bit

In cooperation with Karl-Friedrich von Holleuffer, FN driving instructor and well known expert of horse bits, we developed a bit for the special needs of lunged horses. The cheeks of our gentle bit provide perfect lateral guidance with a centrally fixed mouthpiece. Additionally we added eyelets to minimize the pressure on the neck.

The Longe will be attached to a separate ring of the cheek, the common jam up of the ring is not possible anymore!

The Liverpool Bit is a classical driving bit with several possibilities to attach the reins. The Liverpool Bit is available with two or three slots, a bottom bar can be fixed if required. Furthermore it is possible to incline the angle of the Tongue Port mouthpiece. Tilt the angle forward takes the pressure from the lower jaw and increases the effect on the tongue.

The Postillon Bit is another classical driving bit. The bit offers two possibilities to attach the reins. Attached to the lower ring it works with a moderate lever, attached to the upper ring the bit works as a simple snaffle.

beris Icelandic

The traditional Icelandic Curb Bit was developed for the use in the working horse, nowadays the use in competition becomes more common. The effect of the bit concentrates on jaws and tongue. For this reason this bit requires the soft hands of an experienced rider on a well ridden horse. In this case the beris Icelandic will help to show up the beauty of the horse, especially in Tölt and Pace.

By standard, the Icelandic Curb Bit comes with curb hooks included.
